

Asphalt companies are very important customers to HYCON. They always have a need for compact breakers with high performance – breakers that can be operated without a large compressor.

The advantage of hydraulic breakers is that they can be connected to the hydraulic takeout on the various machines of the asphalt companies. This way it is easy to connect the breaker and get the job done and then move on to the next machine job. Therefore most of the asphalt companies have mounted a breaker ready for use at the side of the machine.

The construction and maintenance of roads is very expensive, and so are the machines and every minute of work is thus very costly.

Therefore the asphalt companies save a lot of money by always keeping a breaker at disposal on the construction site.
